Appling, GA 30802

Mr. Lloyd,

Thanks for the opportunity to aid you in the determination of soil suitability for development at 3095 and 3085 Marshall Road in Appling, GA. A total of 10 borings were augered across both parcels. Seasonal high water table (SHWT) indicators ranged from 20-35 inches below the soil surface. Bedrock was encountered on boring #1 at a depth of 27 inches. The remaining borings were terminated at the sign of SHWT indicators. I suspect other borings are shallow to bedrock. Attached is a topographic map with my soil borings identified and depth to SHWT indicators at each location.

Though the soils were moderately well drained for the most part, they all had a deep loamy sand to sandy loam epipedons which I am confident will facilitate the installation of an alternative septic system such as a drip emitter system or Elgen GFS.

Level 3 soil surveys will be needed once the home sites are determined. Please call or email should you have any questions or concerns.

Sincerely,

Robert Smith
