Re: Soil/Site Evaluation for single family wastewater approval (G.S. 130A-336.2)
property located at Carraway Farms lot 12 in **Pitt** County, NC. (parcel **91836**)

Belvoir Farms,

The referenced property was evaluated for septic system suitability using the *18E Onsite Wastewater Rules* as a reference. As requested, an investigation of this property was performed to locate soil areas suitable for a four-bedroom septic system that would allow placement of conventional drain lines. **The LSS evaluation is being submitted pursuant to and meets the requirements of G.S. 130A-336.2.** The evaluation involved methodically conducting hand auger borings across the property to determine suitability for septic systems. Each boring was located by using a global positioning system (GPS) capable of sub-meter accuracy. The enclosed map identifies primary and repair septic system field areas based on soil findings. An auger boring location map and soil profile descriptions are also included with this this report.

The primary drain field area has sandy loam textured sub-soils and morphology suggests the seasonal soil wetness condition to be **24** inches below the surface. These areas should allow shallow placement of the drain lines, which places the bottom of the drain lines a maximum of **12** inches below the surface. This depth is recommended based on elevation change recorded with a laser level and minimum depths to soil wetness. The imported fill and the area around the drain field will must be shaped to remove surface water. The recommended LTAR for septic systems in this area is **0.8** gallons/day/ft².

The repair drain field area has sandy loam textured sub-soils and morphology suggests the seasonal soil wetness condition to be **36+** below the surface. These areas should allow shallow placement of the drain lines, which places the bottom of the drain lines a maximum of **24 inches** below the surface. This depth is recommended based on elevation change recorded with a laser level and minimum depths to soil wetness. This area should allow shallow placement of the drain lines. The recommended LTAR for a septic system in this area is **0.8** gallons/day/ft².

Any disturbance in the form of filling or excavation can alter the suitability class of the soil group. This report is for information and planning purposes only. The local health department must process and file these private permits for septic systems. This property may be subject to approval by other local, state, or federal agencies. If you have any further questions, please contact me at (252) 341-9707.

Sincerely,

Gene Aston
